

# Solar Sanitary Kit

**COMFORT** for your home  
**PROTECTION** for your boiler

## Universal KIT for connection of solar storage tank to domestic hot water source

It is a connection set to the auxiliary domestic hot water heating equipment that is installed between the solar storage tank and the energy support source, normally a boiler, a heater or an electric water heater. It incorporates a 3-way valve that decides whether the water coming from the solar storage tank must pass through the support source or can be directly taken to consumption; and a mixing valve that regulates the domestic hot water outlet temperature of the solar system + conventional support.

Part No S40000001
