1 General

About this document

The language of the original operating instructions is French. All other languages of these instructions are translations of the original operating instructions.

These installation and operating instructions are an integral part of the product. They must be kept readily available at the place where the product is installed. Strict adherence to these instructions is a precondition for the proper use and correct operation of the product.

These installation and operating instructions correspond to the relevant version of the product and the underlying safety standards valid at the time of going to print.

EC declaration of conformity:

A copy of the EC declaration of conformity is a component of these operating instructions.

If a technical modification is made on the designs named there without our agreement, this declaration loses its validity.

2 Safety

These operating instructions contain basic information which must be adhered to during installation and operation. For this reason, these operating instructions must, without fail, be read by the service technician and the responsible operator before installation and commissioning. It is not only the general safety instructions listed under the main point "safety" that must be adhered to but also the special safety instructions with danger symbols included under the following main points.

2.1 Indication of instructions in the operating instructions

Symbols:

General danger symbol

Danger due to electrical voltage

USEFUL INFORMATION

Signal words:

DANGER!

Acutely dangerous situation

Non-observance results in death or the most serious of injuries.

WARNING!

The user can suffer (serious) injuries. 'Warning' implies that (serious) injury to persons is probable if this information is disregarded.

CAUTION!

There is a risk of damaging to the product/installation. 'Caution' implies that damage to the product is likely if the information is disregarded.

NOTE: Useful information on handling the product. It draws attention to possible problems.

2.2 Personnel qualifications

The installation personnel must have the appropriate qualifications for this work.

2.3 Danger in the event of non-observance of the safety instructions

Non-observance of the safety instructions can result in risk of injury to persons and damage to product/installation. Non-observance of the safety instructions can result in the loss of any claims for damages.

In detail, non-observance can, for example, result in the following risks:

- Failure of important functions of the product/installation,
- Failure of specified maintenance and repair procedures,
- Risks to persons through electrical, mechanical and bacteriological effects,
- Property damage.

2.4 Safety instructions for the operator

The existing directives for accident prevention must be adhered to. Danger from electrical current must be eliminated. Local directives or general directives [e.g. IEC, VDE etc.] and local power supply companies must be adhered to.

This appliance is not intended for use by persons (including children) with reduced physical, sensory or mental capabilities, or lack of experience and knowledge, unless they have been given supervision or instruction concerning use of the appliance by a person responsible for their safety.

Children should be supervised to ensure that they do not play with the appliance.

2.5 Safety instructions for inspection and installation work

The operator must ensure that all inspection and installation work is carried out by authorised and qualified personnel, who are sufficiently informed from their own detailed study of the operating instructions.

Work to the product/installation must only be carried out when at a standstill. It is mandatory that the procedure described in the installation and operating instructions for shutting down the product/unit be complied with.

2.6 Unauthorised modification and manufacture of spare parts

Modifications to the product are only permissible after consultation with the manufacturer. Original spare parts and accessories authorised by the manufacturer ensure safety. The use of other parts can nullify the liability from the results of their usage.

2.7 Improper use

The operational safety of the supplied product is only guaranteed for conventional use in accordance with section 4 of the installation and operating instructions. The limit values must on no account fall under or exceed those specified in the catalogue/data sheet.

3 Transport and interim storage

As soon as the product arrives:

- Check the product for damage in transit,
- In the case of transport damage, initiate the necessary procedures with the forwarding agent within the time stipulated.

CAUTION! Danger of property damage!

Incorrect transport and incorrect intermediate storage can lead to product damage.

- **The pump may only be suspended/carried by the strap provided for transport purposes. The cable should never be used for lifting!**
- **The pump must be protected against moisture, frost and mechanical damage when transported and stored.**

4 Intended use

The Drain TM series drainage and submersible waste water pumps are used:

- for the automatic drainage of pits and shafts,
- for keeping dry yard areas and basement rooms exposed to flooding,
- for lowering surface water, if the waste water is not able to flow off into the sewer system through natural fall.

The pumps are suitable for pumping slightly contaminated water, rainwater, drainage water and washing water.

TMR pumps versions are intended for pumping down to 2 mm suction level from the floor. This version is recommended for mobile installation and pumping clear water.

The pumps are usually installed under water (submerged) and can only be permanently or temporarily installed vertically. Because of the sheath current cooling, the pumps can also be operated unsubmerged.

Submersible pumps with a mains connection cable of less than 10 metres are (according to EN 60335) only permitted for use inside buildings, i.e. not for operating outside.

Pumps that are intended for use in or at garden ponds or similar places must have a mains connecting cable that is not lighter than rubber sheathed cables reference H07 RN-F (245 IEC 66) according to EN 60335.

Danger! Mortal danger due to electric shock

The pump many not be used to drain swimming pools / garden ponds or similar places if anyone is in the water.

WARNING! Hazardous to health!

Owing to the materials used, the pumps are not suitable for potable water! Unpurified foul and waste water represents a health hazard.

CAUTION! Danger of property damage!

Pumping unpermitted substances can lead to product damage.

The pumps are not suitable for water with coarse contamination such as sand, fibres or combustible, caustic fluids or for use in potentially explosive areas.

Correct use of the product also includes following these instructions.

Any use over and beyond these is interpreted as incorrect use.

5 Product information

5.1 Type key

**Example: TM 32/8 -10M
TMW 32/11 HD**

TM	Submersible pump
W	W = with whirl system (TWISTER function) R = low suction version
32	Nominal diameter of pressure port [mm]: 32 = Rp 1½
/8	Max. delivery head [m] when Q = 0m³/h
HD	For aggressive water (material 1.4435 (AISI316L))
10M	Length of mains connecting cable [m]: 10

5.2 Technical data

Mains voltage:	1~230 V, ± 10 %
Mains frequency:	50 Hz
Protection class:	IP 68
Insulation class:	155
Speed:	2900 rpm (50 Hz)
Max. current consumption:	See name plate
Power consumption P ₁ :	See name plate
Max. flow rate:	See name plate
Max. delivery head:	See name plate
Operating mode S1:	200 operating hours a year

5.2 Technical data

Operating mode S3 (optimum):	Intermittent duty, 25 % (2.5 min. operation, 7.5 min. interval).
Recommended switching frequency:	20/h
Max. switching frequency:	50/h
Free ball passage:	10 mm (Model TMR: 2 mm)
Nominal diameter of the pressure port:	Ø 32 mm (Rp 1¼), grooved hose connector Ø 35 mm supplied with TM32/7 and TM32/8-10M
Admissible fluid temperature: briefly 3 min.:	+3 to 35 °C 90 °C
Max. submersion depth :	4 m connecting cable = 1 m – 10 m connecting cable = 3 m
Flat suction up to:	14 mm (Model TMR: 2 mm)
Maximum fluid density:	1060 kg/m³

5.3 Scope of delivery

- Pump with
- 4 m connecting cable with mains plug (Model TM ... 10M: 10 m)
 - Connected float switch (except TM32/8-10M)
 - Whirl self cleaning system (TWISTER function) for TMW
 - Pressure port Rp 1¼ (Model TM32/7 and TM32/8-10M: grooved hose connector Ø 35 mm)
 - Non-return valve (except TM32/7 and TM32/8-10M)
 - Installation and operating instructions

5.4 Accessories

- Accessories must be ordered separately (see catalogue):
- Switchgear for 1 or 2 pump operation
 - Alarm switchgear AlarmControl with mini float switch and plug
 - External monitoring devices / tripping unit
 - Level control (e.g. flow switch)
 - Accessories for transportable wet sump installation (e.g. hose couplings, hoses, etc.).
 - Accessories for stationary wet sump installation (e.g. check valves, non-return valves, etc.)

The use of new accessories is recommended.

6 Description and function

6.1 Description of the product (Fig. 1)

Pos.	Description of the component	Pos.	Description of the component
1	Cable	13	Screw
2	Screw	14	Diffusor
3	O-ring	15	Strainer
4	Motor housing	16	Mechanical seal
5	Screw	17	O-ring
6	External housing	18	Rotary shaft seal
7	Float swich	19	O-ring
8	Screw	20	Non-return valve
9	Screw	21	Pressure port Rp 1¼
10	Nut	22	Handle
11	Impeller	23	Grooved hose connector
12	Whirl system (TWISTER function)		

The pump can be completely submerged in the fluid.

The electric motor is protected against the pump chamber by a rotary shaft seal to seal the motor against the oil chamber and a mechanical seal to seal the oil chamber against the fluid. The mechanical seal chamber is filled with medical white oil so that the mechanical seal is lubricated and cooled during a dry run. A further rotary shaft seal protects the mechanical seal facing the fluid. The motor is cooled by the surrounding fluid.

The pump is installed on the floor of a shaft. For a stationary installation, it is bolted to a fixed pressure pipe or for a transportable installation, it is connected to a hose connection.

The pumps are commissioned by plugging in the protective contact plug.

They operate automatically, when the float switch switches the pump on from a certain water level "h" (Fig. 2) and switches it off at a minimum water level "h1".

The motors are equipped with thermal motor protection, which switches off the motor automatically if it overheats and switches it on again when it has cooled down. The condenser is integrated in the single-phase motor.

Version with whirl system (TWISTER function)

For waste water with precipitating and floating particles, the submersible pump has been equipped with a whirl system at the suction strainer. Precipitating particles are continuously whirled up in the suction area of the pump and pumped off with the water. Therefore, mud accumulation in the pump shaft, with problematic consequences such as clogging of the pump and odour formation, is largely prevented.

If the removal of the waste water does not allow any interruption, a second pump (automatic standby pump), together with the necessary switchgear (accessory), increases the operating reliability if the 1st pump develops a fault.

7 Installation and electrical connection

DANGER! Risk of fatal injury!

- Incorrect installation and improper electrical connections can result in a risk of fatal injury.
- The installation and electrical connections should only be done by properly skilled staff and in compliance with the applicable regulations!
- Follow all accident prevention regulations!

7.1 Installation

The pump is designed for stationary or transportable installation.

CAUTION! Danger of property damage!

Danger of damage due to incorrect handling.

Only suspend the pump by the strap with the aid or a chain or rope, never by the electrical or float switch cable or the pipe/hose connection.

The installation site or shaft for the pump must be free of frost.

The shaft must be cleared of coarse material such as rubble before setting up and starting the pump. The quality of the shaft must guarantee the unhindered mobility of the float switch.

Installation dimension / shaft dimensions (cf. Fig 2)

Pump	H _{min}	B _{min}	L	D
[mm]				
TM 32/7	280	350 x 350	294	165
TM 32/8	280	350 x 350	293	165
TM 32/11	330	350 x 350	323	165

Pump	h _{max}	h _{1_min}	h _{2_min}
[mm]			
TM 32/7	237	50	14
TM 32/8	250	50	14
TM 32/11	280	50	14

The diameter of the pressure pipe (pipe/hose connection) should not be smaller than the pressure connection of the pipe because of the increased risk of clogging and greater pressure losses. To avoid pressure losses, it is recommended that the pipe connection one number higher is selected.

Stationary wet sump installation

In the case of a stationary wet sump installation of the pump with a permanent pressure pipe, the pump must be positioned and secured so that:

- The pressure pipe connection does not support the weight of the pump.
- The load of the pressure pipe does not act on the connecting socket.
- The pump is installed stress-free.

To protect against any backflow from the public drainage pipe, the pressure pipe must be taken in an arc over the locally established backflow level (usually street level). A non-return valve does not represent a guaranteed backflow seal.

- The attached non-return valve should be installed if the pump is installed permanently.

- Seal the pipe connections to the pressure port with Teflon tape.

NOTE: Permanent leakage in this area can lead to destruction of the non-return valve and of the screwed connection.

Transportable wet sump installation

In the case of a transportable wet sump installation with hose connection, the pump must be secured in the shaft to prevent it from falling over and wandering (e.g. secure chain / rope with slight pre-tension).

NOTE: When used in a sump without a firm base, the pump must be put on a sufficiently large plate or hung from a rope or a chain in a suitable position.

7.2 Electrical connection

DANGER! Risk of fatal injury!

If the electrical connection is not made properly, there is a risk of fatal injury from electric shock. Only allow the electrical connection to be made by an electrician approved by the local electricity supplier and in accordance with the local regulations in force.

- The type of mains connection current and voltage must correspond to the details on the name plate
- Fuse in the power supply: 10 A, slow,
- Earth the installation according to the regulations.
- The installation of a leakage current protection switch to be provided on site for a trip current of 30 mA is recommended (caution when installing outside).

- The pump is ready to connect.

To connect the pump to the switchgear, the shock-proof plug is disconnected and the connecting cable is then connected as follows (see Installation and operating instructions for the switchgear):

3-wire connection cable: 3x1.0 mm²

Conductor	Terminal
brown	L1
blue	N
green/yellow	PE

Socket and switchgear must be installed in a dry room and protected against flooding.

8 Commissioning

DANGER! Danger through electric shock!

The pump may not be used to drain swimming pools / garden ponds or similar place if anyone is in the water.

CAUTION! Danger of property damage!

Do not allow the mechanical seal to run dry!

Dry running shortens the service life of the motor and the mechanical seal. If the mechanical seal is damaged, small amounts of oil may escape into the pumped fluid.

- When filling the shaft or lowering the pump into the pit, make sure that the float switches can move freely. The switch must switch off the pump before the intake openings of the pump can draw in air.
 - After filling the shaft and opening the check valve on the pressure side (if provided), the pump starts up automatically when the switch-on level "h" is reached and switches off as soon as the switch-off level "h1" responds.
 - Do not direct the jet of water to be fed into the shaft at the suction strainer of the pump. Entrained air can prevent the operating pump from functioning if the vent slit in the housing is blocked.
 - The maximum volume of water entering the shaft must not exceed the performance of the pump. Keep an eye on the shaft when commissioning the pump.
- NOTE:** The venting of the pump when commissioned for the first time will be improved by submersion in the fluid at an angle or by positioning it at a slight angle.

Adjusting the switching level of the float switch

The perfect functioning of the level control system is guaranteed if the details according to the table in 7.1 and Fig. 2 are observed.

The switching level (switch-on/off point) can be changed via the free float switch cable by moving the cable within the clip on the pump handle. The level "h2 min" must be respected (see Fig. 2). On version TMR, to reach the maximum low suction level, the float switch must be manually lifted. A small degree of water evacuation (lateral slit between suction strainer and housing) when level "h2" is reached is normal and necessary to ensure the operational safety of the pump.

- Do not direct the jet of water to be fed into the shaft at the suction strainer of the pump. Entrained air can prevent the operating pump from functioning if the vent slit in the housing is blocked.
- The maximum quantity of water feeding into the shaft may not exceed the pump's capacity. Monitor the sump during commissioning.
- To increase the required capacity (by approx. 16% of the delivery head) the whirl system device of the TMW pump can be shut down as follows (fig. 3):
 - Pull the mains plug,
 - Remove pump from the sump,
 - Remove the 4 screws (pos. 2) below the suction basket,
 - Remove the whirl device (pos. 1), rotate by 180° and secure again with the 4 screws,
 - Lower pump again and start up.

9 Maintenance

Maintenance and repairs may only be carried out by qualified experts!

DANGER! Risk of fatal injury!

There is a mortal danger through shock when working on electrical equipment.

- Before any maintenance and repair work, the pump must be switched off and prevented from being switched on again in an unauthorised manner.
- Damage to the connecting cable may only be repaired by a qualified electrical contractor in principle.
- When checking the function following long downtimes, avoid contact with the fluid.

In order to prevent blockage of the pump resulting from long downtimes, its ability to function should be checked at regular intervals (every 2 months) by manual raising of the float switch or direct switching-on and brief start-up of the pump. Minor wear of the rotary shaft seal and mechanical seal can lead to fouling of the liquid following an oil leak from the oil chamber.

The pump should therefore be serviced after approx. 2000 operating hours by a specialist or Wilo After-sales Service, mainly in order to check the seals.

Only specialist companies or Wilo After-sales Service may open the encapsulated motor.

Cleaning the pump

Depending on the use of the pump, fouling can occur within the suction strainer and the impeller. Rinse off the pump under running water after use.

- 1 Switch off the power supply. Disconnect the mains plug.
- 2 Drain the pump

TMW:

- 3 The whirl device is screwed to the suction strainer (fig. 3).
 - Loosen 4 screws ($\varnothing 3.5 \times 14$),
 - Remove whirl device,
- 4 The suction strainer is screwed to the pump housing,
 - Loosen 4 screws ($\varnothing 4 \times 60$),
 - Remove suction strainer, handle O-ring ($\varnothing 155 \times 2$) between suction strainer / pump housing and O-ring ($\varnothing 14 \times 2$) in the bypass hole (necessary for the whirl function) with care.

TM/TMR:

- 4 The suction strainer is screwed to the pump housing,
 - Loosen 4 screws ($\varnothing 4 \times 60$),
 - Remove suction strainer, handle O-ring ($\varnothing 155 \times 2$) between suction strainer / pump housing with care.
- 5 Clean the impeller and pump housing under running water. The impeller must turn freely.
- 6 Replace damaged or worn parts with original spares.
- 7 Re-assembly the pump in the reverse order.

10 Faults, causes and remedies

Only have faults remedied by qualified personnel!
Observe safety instructions in 9 Maintenance.

Fault	Cause	Remedy
The pump does not start or stops during operation	Current supply interrupted	Check fuses, cables and electrical connections.
	Motor protection switch has tripped	Allow the pump to cool down, it will start again automatically
	Fluid temperature too high	Allow to cool down
	Pump silted up or blocked	Disconnect the pump from the mains and remove from the shaft. Remove the suction strainer and rinse the suction strainer / impeller under running water
Pump does not switch on/off	Float switch blocked or cannot move freely	Check float switch and ensure mobility
Pump does not pump	Air in the installation cannot escape	Place the pump at an angle in water briefly until the air escapes. Vent the installation / drain if necessary Dismantle suction strainer / whirl device, rinse suction strainer / vent slit under running water. Check the switch-off level "h1"
	Water level below the intake port	If possible, submerge the pump deeper (observe the switch-off level)
	Pressure pipe / hose diameter too small (losses too high)	Bigger dimensioning of the pressure pipe / hose diameters
	Non-return valve sticking in the pressure port	Check function
	Hose kinked / check valve closed	Clear kink in hose / open check valve
	Suction strainer blocked / impeller blocked	Disconnect the pump from the mains and remove from the shaft. Remove the suction strainer and rinse the suction strainer / impeller under running water.

If the fault cannot be remedied, please contact the trade or your nearest Wilo-After-sales Service or agent.

11 Spare parts

Spares should be ordered through local trade outlets and/or the Wilo-After-sales Service.

To avoid queries and incorrect orders, all the data on the name plate must be indicated when ordering.

Subject to change without prior notice!
