

Sotin 270 Acidic cleaner for gas-fired condensing boilers

Problem solver for gas-fired condensing boilers made of aluminium-silicon or stainless steel

Ready to use

Sotin 270 is a liquid, extra strong, acidic special cleaner for gas-fired condensing boilers made of aluminium-silicon or stainless steel. Excellent for removing the toughest contamination and the most stubborn deposits.

Application: Spray Sotin 270 onto the contaminated surfaces using a chemical-resistant pressure sprayer, e.g. a Sotin J3 pressure sprayer, article Nos. 910-1010. Allow the cleaning solution 5 - 15 minutes to react. The cleaning agent must not be allowed to dry out. If possible, assist the cleaning process mechanically using the cleaning aid provided by the manufacturer. The combustion chamber must be rinsed thoroughly with water after use.

To neutralise the surface, we recommend wetting the cleaned surfaces thoroughly with Sotin 216 surface neutraliser and then rinsing with clear water.

Note: Sotin 270 can be used both as a basic cleaner and for annual maintenance work.
